- Last day to add is today.

Some Logistics

- Last day to add is today.
- (Poll) The demo last time.

Recap on Permissions

The Octal Version of **chmod**

Last time I linked you to this[2] website for a good explanation. For the formula hungry, you can represent **r**, **w**, and **x** as binary variables (where 0 is off, and 1 is on). Then the formula for the modes is

The Octal Version of **chmod**

Last time I linked you to this[2] website for a good explanation. For the formula hungry, you can represent **r**, **w**, and **x** as binary variables (where 0 is off, and 1 is on). Then the formula for the modes is

$$r \cdot 2^2 + w \cdot 2^1 + x \cdot 2^0$$

The Octal Version of **chmod**

Last time I linked you to this[2] website for a good explanation. For the formula hungry, you can represent `r`, `w`, and `x` as binary variables (where 0 is off, and 1 is on). Then the formula for the modes is

$$r \cdot 2^2 + w \cdot 2^1 + x \cdot 2^0$$

Examples

- `chmod 755`: `rwxr-xr-x`
- `chmod 777`: `rwxrwxrwx`
- `chmod 600`: `rw-------`

The Octal Version of **chmod**

Last time I linked you to this[2] website for a good explanation. For the formula hungry, you can represent `r`, `w`, and `x` as binary variables (where 0 is off, and 1 is on). Then the formula for the modes is

$$r \cdot 2^2 + w \cdot 2^1 + x \cdot 2^0$$

Examples

- `chmod 755`: `rwxr-xr-x`
- `chmod 777`: `rwxrwxrwx`
- `chmod 600`: `rw-------`

If that makes less sense to you, feel free to ignore it.

Super Confused...

Superuser Do

`sudo <command>`

- Execute **`<command>`** as the super user.
- The regular user (e.g. **`student`**) is executing the **`sudo`** command, *not* the **`root`**.
- You enter *your* user password.
- You can only execute **`sudo`** if you are an "administrator"*.

Super Confused...

Superuser Do

`sudo <command>`

- Execute **<command>** as the super user.
- The regular user (e.g. **student**) is executing the **sudo** command, *not* the **root**.
- You enter *your* user password.
- You can only execute **sudo** if you are an "administrator"*.

- On the course VMs the **student** user originally had the password **student**, so that is what you would type if you were executing **sudo**.

Super Confused...

Superuser Do

`sudo <command>`

- Execute **<command>** as the super user.
- The regular user (e.g. **student**) is executing the **sudo** command, *not* the **root**.
- You enter *your* user password.
- You can only execute **sudo** if you are an "administrator"*.

- On the course VMs the **student** user originally had the password **student**, so that is what you would type if you were executing **sudo**.
- On your personal Mac (or native Linux install), you would be typing whatever your password is to login to the computer.

Super Confused...

Superuser Do

`sudo <command>`

- Execute **<command>** as the super user.
- The regular user (e.g. **student**) is executing the **sudo** command, *not* the **root**.
- You enter *your* user password.
- You can only execute **sudo** if you are an "administrator"*.

- On the course VMs the **student** user originally had the password **student**, so that is what you would type if you were executing **sudo**.
- On your personal Mac (or native Linux install), you would be typing whatever your password is to login to the computer.

*Note that where you look to see who can execute **sudo** varies greatly between distributions.

Super Confused...

If you know the `root` password, then you can become `root` using `su` directly.

Super Confused...

If you know the `root` password, then you can become `root` using `su` directly.

Switch User

```
su <user_name>
```

- Switches to user `user_name`.
- The password you enter is the password for `user_name`.
- If no username is specified, `root` is implied.

Super Confused...

If you know the `root` password, then you can become `root` using `su` directly.

Switch User

`su <user_name>`

- Switches to user `user_name`.
- The password you enter is the password for `user_name`.
- If no username is specified, `root` is implied.

- The commands `sudo su root` and `sudo su` are equivalent:

Super Confused...

If you know the `root` password, then you can become `root` using `su` directly.

Switch User

`su <user_name>`

- Switches to user `user_name`.
- The password you enter is the password for `user_name`.
- If no username is specified, `root` is implied.

- The commands `sudo su root` and `sudo su` are equivalent:
  - Since you typed `sudo` first, that is why you type the user password.

Super Confused...

If you know the `root` password, then you can become `root` using `su` directly.

Switch User

`su <user_name>`

- Switches to user `user_name`.
- The password you enter is the password for `user_name`.
- If no username is specified, `root` is implied.

- The commands `sudo su root` and `sudo su` are equivalent:
  - Since you typed `sudo` first, that is why you type the user password.
- If you just execute `su` directly, then you have to type the `root` password.

Default Permissions

When you create files during a particular session, the mode you are running in determines what the permissions will be.

Default Permissions

When you create files during a particular session, the mode you are running in determines what the permissions will be.

User mask

`umask <mode>`

- Remove `mode` from the file's permissions.
- Similar syntax to `chmod`:
  - `umask 077`: full access to the user, no access to anybody else.
  - `umask g+w`: enables group write permissions.
- `umask -S`: display the current mask.

Default Permissions

When you create files during a particular session, the mode you are running in determines what the permissions will be.

User mask

`umask <mode>`

- Remove `mode` from the file's permissions.
- Similar syntax to `chmod`:
  - `umask 077`: full access to the user, no access to anybody else.
  - `umask g+w`: enables group write permissions.
- `umask -S`: display the current mask.

- Changing the `umask` only applies for the remainder of the session (e.g. until you close the terminal window you were writing this in).

Default Permissions

When you create files during a particular session, the mode you are running in determines what the permissions will be.

User mask

`umask <mode>`

- Remove `mode` from the file's permissions.
- Similar syntax to `chmod`:
  - `umask 077`: full access to the user, no access to anybody else.
  - `umask g+w`: enables group write permissions.
- `umask -S`: display the current mask.

- Changing the `umask` only applies for the remainder of the session (e.g. until you close the terminal window you were writing this in).
- If this has meaning, it is just a bit mask with `0o777`.

File Compression

Making Archives: Zip

Zip

```
zip <name_of_archive> <files_to_include>
```

- Note I said *files*.
  - E.g. `zip files.zip a.txt b.txt c.txt`
  - These will extract to `a.txt`, `b.txt`, and `c.txt` in the current directory.
- To do folders, you need recursion.
  - `zip -r folder.zip my_files/`
  - This will extract to a folder named `my_files`, with whatever was inside of it in tact.

Unzip

```
unzip <archive_name>
```

Note: The original files DO stay in tact.

Making Archives: Gzip

Gzip

```
gzip <files_to_compress>
```

- Less time to compress, larger file: `--fast`
- More time to compress, smaller file: `--best`
- Read the `man` page, lots of options.

Gunzip

```
gunzip <archive_name>
```

Notes:

- By default, *replaces* the original files!
  - You can use `--keep` to bypass this.
- Does not bundle the files.
- Usually has better compression than `zip`.

Making Archives: Tar

Tape Archive

```
tar -cf <tar_archive_name> <files_to_compress>
```

- Create a tar archive.

```
tar -xf <tar_archive_name>
```

- Extract all files from archive.

Notes:

- `tar` is just a bundling suite, creating a single file.
- By default, it does *not* compress.
- Original files DO stay in tact.
- Unlike `zip`, you do not need the `-r` flag for folders :)

Making Archives: Tarballs

Making tarballs

```
tar -c(z/j)f <archive_name> <source_files>
tar -x(z/j)f <archive_name>
```

- `(z/j)` here means *either* `z` *or* `j`, not both.
- The `-z` flag specifies `gzip` as the compression method.
- YOU have to specify the file extension.
  - Extension convention: `.tar.gz`
  - Example: `tar -cjf files.tar.gz files/`
- The `-j` flag specifies `bzip2` as the compression method.
  - Extension convention: `.tar.bz2`
  - Example: `tar -cjf files.tar.bz2 files/`

Note:

- Extraction can *usually* happen automatically:
  - `tar -xf files.tar.gz` will usually work (no `-z`)

Assorted Commands

Before we can Chain...

...we need some more interesting tools to chain together!

Counting

Word Count

`wc [options] <file>`

- `-l`: count the number of lines.
- `-w`: count the number of words.
- `-m`: count the number of characters.
- `-c`: count the number of bytes.

Counting

Word Count

`wc [options] <file>`

- `-l`: count the number of lines.
- `-w`: count the number of words.
- `-m`: count the number of characters.
- `-c`: count the number of bytes.

Great for things like:

Counting

Word Count

`wc [options] <file>`

- `-l`: count the number of lines.
- `-w`: count the number of words.
- `-m`: count the number of characters.
- `-c`: count the number of bytes.

Great for things like:

- revelling in the number of lines you have programmed.

Counting

Word Count

`wc [options] <file>`

- `-l`: count the number of lines.
- `-w`: count the number of words.
- `-m`: count the number of characters.
- `-c`: count the number of bytes.

Great for things like:

- revelling in the number of lines you have programmed.
- analyzing the verbosity of your personal statement.

Counting

Word Count

`wc [options] <file>`

- `-l`: count the number of lines.
- `-w`: count the number of words.
- `-m`: count the number of characters.
- `-c`: count the number of bytes.

Great for things like:

- revelling in the number of lines you have programmed.
- analyzing the verbosity of your personal statement.
- showing people how cool you are.

Sorting

Sort

`sort [options] <file>`

- Default: sort by the `ASCII` code (roughly alphabetical) for the whole line.
- Use `-r` to reverse the order.
- Use `-n` to sort by numerical order.
- Use `-u` to remove duplicates.

Sorting

Sort

`sort [options] <file>`

- Default: sort by the `ASCII` code (roughly alphabetical) for the whole line.
- Use `-r` to reverse the order.
- Use `-n` to sort by numerical order.
- Use `-u` to remove duplicates.

```
>>> cat peeps.txt
Manson, Charles
Bundy, Ted
Bundy, Jed
Nevs, Sven
Nevs, Sven
```

```
>>> sort -r peeps.txt
Nevs, Sven
Nevs, Sven
Manson, Charles
Bundy, Ted
Bundy, Jed
```

```
>>> sort -ru peeps.txt
Nevs, Sven
Manson, Charles
Bundy, Ted
Bundy, Jed
# only 1 Nevs, Sven
```

Advanced Sorting

- The `sort` command is quite powerful, for example you can do:

Advanced Sorting

- The `sort` command is quite powerful, for example you can do:

```
>>> sort -n -k 2 -t "," <filename>
```

Advanced Sorting

- The `sort` command is quite powerful, for example you can do:

```
>>> sort -n -k 2 -t "," <filename>
```

- Sorts the file numerically by using the second column, separating by a comma as the delimiter instead of a space.

Advanced Sorting

- The `sort` command is quite powerful, for example you can do:

```
>>> sort -n -k 2 -t "," <filename>
```

- Sorts the file numerically by using the second column, separating by a comma as the delimiter instead of a space.
- Read the `man` page!

Advanced Sorting

- The `sort` command is quite powerful, for example you can do:

```
>>> sort -n -k 2 -t "," <filename>
```

- Sorts the file numerically by using the second column, separating by a comma as the delimiter instead of a space.
- Read the `man` page!

```
>>> cat numbers.txt
02,there
04,how
01,hi
06,you
03,bob
05,are
```

Advanced Sorting

- The `sort` command is quite powerful, for example you can do:

```
>>> sort -n -k 2 -t "," <filename>
```

- Sorts the file numerically by using the second column, separating by a comma as the delimiter instead of a space.
- Read the `man` page!

```
>>> cat numbers.txt
02,there
04,how
01,hi
06,you
03,bob
05,are
```

```
>>> sort -n -k 2 -t "," numbers.txt
01,hi
02,there
03,bob
04,how
05,are
06,you
```

Special Snowflakes

Unique

`uniq [options] <file>`

- No flags: discards all but one of successive identical lines.
- Use `-c` to prints the number of successive identical lines next to each line.

Search and Replace

Translate

`tr [options] <set1> [set2]`

- Translate or delete characters.
- Sets are strings of characters.
- By default, searches for strings matching `set1` and replaces them with `set2`.
- You can use POSIX and custom-defined *sets* (we'll get there soon!).

Search and Replace

Translate

`tr [options] <set1> [set2]`

- Translate or delete characters.
- Sets are strings of characters.
- By default, searches for strings matching `set1` and replaces them with `set2`.
- You can use POSIX and custom-defined *sets* (we'll get there soon!).

- The `tr` command only works with streams.

Search and Replace

Translate

`tr [options] <set1> [set2]`

- Translate or delete characters.
- Sets are strings of characters.
- By default, searches for strings matching `set1` and replaces them with `set2`.
- You can use POSIX and custom-defined *sets* (we'll get there soon!).

- The `tr` command only works with streams.
- Examples to come after we learn about chaining commands in the next section.

Chaining Commands

Your Environment and Variables

- There are various environment variables defined in your environment. They are almost always all capital letters.

Your Environment and Variables

- There are various environment variables defined in your environment. They are almost always all capital letters.
- You obtain their value by dereferencing them with a `$`.

Your Environment and Variables

- There are various environment variables defined in your environment. They are almost always all capital letters.
- You obtain their value by dereferencing them with a `$`.

```
>>> echo $PWD    # present working directory
>>> echo $OLDPWD # print previous working directory
>>> printenv     # print all environment variables
```

Your Environment and Variables

- There are various environment variables defined in your environment. They are almost always all capital letters.
- You obtain their value by dereferencing them with a `$`.

```
>>> echo $PWD    # present working directory
>>> echo $OLDPWD # print previous working directory
>>> printenv     # print all environment variables
```

- When you execute commands, they have something called an "exit code".

Your Environment and Variables

- There are various environment variables defined in your environment. They are almost always all capital letters.
- You obtain their value by dereferencing them with a `$`.

```
>>> echo $PWD    # present working directory
>>> echo $OLDPWD # print previous working directory
>>> printenv     # print all environment variables
```

- When you execute commands, they have something called an "exit code".
- The exit code of the last command executed is stored in the `$?` environment variable.

What is Defined?

- The environment:

What is Defined?

- The environment:
  - **env**: displays all environment variables.

What is Defined?

- The environment:
  - `env`: displays all environment variables.
  - `unsetenv <name>`: remove an environment variable.

What is Defined?

- The environment:
  - `env`: displays all environment variables.
  - `unsetenv <name>`: remove an environment variable.
- The local variables:

What is Defined?

- The environment:
  - `env`: displays all environment variables.
  - `unsetenv <name>`: remove an environment variable.
- The local variables:
  - `set`: displays all shell / local variables.

What is Defined?

- The environment:
  - `env`: displays all environment variables.
  - `unsetenv <name>`: remove an environment variable.
- The local variables:
  - `set`: displays all shell / local variables.
  - `unset <name>`: remove a shell variable.

What is Defined?

- The environment:
  - `env`: displays all environment variables.
  - `unsetenv <name>`: remove an environment variable.
- The local variables:
  - `set`: displays all shell / local variables.
  - `unset <name>`: remove a shell variable.
- We'll cover these a little more when we talk about customizing your terminal shell.

Exit Codes

- There are various exit codes, here are a few examples:

Exit Codes

- There are various exit codes, here are a few examples:

```
>>> super_awesome_command
bash: super_awesome_command: command not found...
>>> echo $?
127
>>> echo "What is the exit code we want?"
>>> echo $?
0
```

Exit Codes

- There are various exit codes, here are a few examples:

```
>>> super_awesome_command
bash: super_awesome_command: command not found...
>>> echo $?
127
>>> echo "What is the exit code we want?"
>>> echo $?
0
```

  - The success code we want is actually **0**. Refer to [3] for some more examples.

Exit Codes

- There are various exit codes, here are a few examples:

```
>>> super_awesome_command
bash: super_awesome_command: command not found...
>>> echo $?
127
>>> echo "What is the exit code we want?"
>>> echo $?
0
```

  - The success code we want is actually `0`. Refer to [3] for some more examples.
  - Remember that `cat /dev/urandom` trickery? You will have to `ctrl+c` to kill it, what would the exit code be?

Executing Multiple Commands in a Row

With exit codes, we can define some simple rules to chain commands together:

Executing Multiple Commands in a Row

With exit codes, we can define some simple rules to chain commands together:

- Always execute:

Executing Multiple Commands in a Row

With exit codes, we can define some simple rules to chain commands together:

- Always execute:

```
>>> cmd1; cmd2   # exec cmd1 first, then cmd2
```

Executing Multiple Commands in a Row

With exit codes, we can define some simple rules to chain commands together:

- Always execute:

```
>>> cmd1; cmd2   # exec cmd1 first, then cmd2
```

- Execute conditioned upon exit code:

Executing Multiple Commands in a Row

With exit codes, we can define some simple rules to chain commands together:

- Always execute:

```
>>> cmd1; cmd2   # exec cmd1 first, then cmd2
```

- Execute conditioned upon exit code:

```
>>> cmd1 && cmd2 # exec cmd2 only if cmd1 returned 0
>>> cmd1 || cmd2 # exec cmd2 only if cmd1 returned NOT 0
```

Executing Multiple Commands in a Row

With exit codes, we can define some simple rules to chain commands together:

- Always execute:

```
>>> cmd1; cmd2   # exec cmd1 first, then cmd2
```

- Execute conditioned upon exit code:

```
>>> cmd1 && cmd2 # exec cmd2 only if cmd1 returned 0
>>> cmd1 || cmd2 # exec cmd2 only if cmd1 returned NOT 0
```

- Kind of backwards, in terms of what means continue for *and*, but that was likely easier to implement since there is only one `0` and many not `0`'s.

Piping Commands

Bash scripting is all about combining simple commands together to do more powerful things. This is accomplished using the "pipe" character.

Piping Commands

Bash scripting is all about combining simple commands together to do more powerful things. This is accomplished using the "pipe" character.

Piping

```
<command1> | <command2>
```

- Passes the output from `command1` to be the input of `command2`.
- Works for *heaps* of programs that take input and provide output to the terminal.

Some Piping Examples

Piping along...

```
>>> ls -al /bin | less
```

- Allows you to scroll through the long list of programs in `/bin`

```
>>> history | tail -20 | head -10
```

- Displays the 10^{th} - 19^{th} previous commands from the previous session.

```
>>> echo * | tr ' ' '\n'
```

- Replaces all spaces characters with new lines.
- Execute just `echo *` to see the difference.

Redirection

To redirect input / output streams, you can use one of **>**, **>>**, **<**, or **<<**.

Redirection

To redirect input / output streams, you can use one of `>`, `>>`, `<`, or `<<`.

- To redirect standard output, use the `>` operator.

Redirection

To redirect input / output streams, you can use one of `>`, `>>`, `<`, or `<<`.

- To redirect standard output, use the `>` operator.
  - `command > file`

Redirection

To redirect input / output streams, you can use one of `>`, `>>`, `<`, or `<<`.

- To redirect standard output, use the `>` operator.
  - `command > file`
- To redirect standard input, use the `<` operator.

Redirection

To redirect input / output streams, you can use one of `>`, `>>`, `<`, or `<<`.

- To redirect standard output, use the `>` operator.
  - `command > file`
- To redirect standard input, use the `<` operator.
  - `command < file`

Redirection

To redirect input / output streams, you can use one of `>`, `>>`, `<`, or `<<`.

- To redirect standard output, use the `>` operator.
  - `command > file`
- To redirect standard input, use the `<` operator.
  - `command < file`
- To redirect standard error, use the `>` operator and specify the stream number `2`.

Redirection

To redirect input / output streams, you can use one of `>`, `>>`, `<`, or `<<`.

- To redirect standard output, use the `>` operator.
  - `command > file`
- To redirect standard input, use the `<` operator.
  - `command < file`
- To redirect standard error, use the `>` operator and specify the stream number `2`.
  - `command 2> file`

Redirection

To redirect input / output streams, you can use one of `>`, `>>`, `<`, or `<<`.

- To redirect standard output, use the `>` operator.
  - `command > file`
- To redirect standard input, use the `<` operator.
  - `command < file`
- To redirect standard error, use the `>` operator and specify the stream number `2`.
  - `command 2> file`
- Combine streams together by using `2>&1` syntax.

Redirection

To redirect input / output streams, you can use one of `>`, `>>`, `<`, or `<<`.

- To redirect standard output, use the `>` operator.
  - `command > file`
- To redirect standard input, use the `<` operator.
  - `command < file`
- To redirect standard error, use the `>` operator and specify the stream number `2`.
  - `command 2> file`
- Combine streams together by using `2>&1` syntax.
  - This says: send standard error to where standard output is going.

Redirection

To redirect input / output streams, you can use one of `>`, `>>`, `<`, or `<<`.

- To redirect standard output, use the `>` operator.
  - `command > file`
- To redirect standard input, use the `<` operator.
  - `command < file`
- To redirect standard error, use the `>` operator and specify the stream number `2`.
  - `command 2> file`
- Combine streams together by using `2>&1` syntax.
  - This says: send standard error to where standard output is going.
  - Useful for debugging / catching error messages...

Redirection

To redirect input / output streams, you can use one of `>`, `>>`, `<`, or `<<`.

- To redirect standard output, use the `>` operator.
  - `command > file`
- To redirect standard input, use the `<` operator.
  - `command < file`
- To redirect standard error, use the `>` operator and specify the stream number `2`.
  - `command 2> file`
- Combine streams together by using `2>&1` syntax.
  - This says: send standard error to where standard output is going.
  - Useful for debugging / catching error messages...
  - ...or ignoring them (you will often see that sent to `/dev/null`).

Redirection Example

- Bash processes I/O redirection from left to right, allowing us to do fun things like this:

Redirection Example

- Bash processes I/O redirection from left to right, allowing us to do fun things like this:

Magic

```
tr -cd '0-9' < test1.txt > test2.txt
```

Redirection Example

- Bash processes I/O redirection from left to right, allowing us to do fun things like this:

Magic

```
tr -cd '0-9' < test1.txt > test2.txt
```

- Deletes everything but the numbers from `test1.txt`, then store them in `test2.txt`.

Redirection Example

- Bash processes I/O redirection from left to right, allowing us to do fun things like this:

Magic

```
tr -cd '0-9' < test1.txt > test2.txt
```

- Deletes everything but the numbers from `test1.txt`, then store them in `test2.txt`.
- CAUTION: do not *ever* use the same file as output that was input.

Redirection Example

- Bash processes I/O redirection from left to right, allowing us to do fun things like this:

Magic

```
tr -cd '0-9' < test1.txt > test2.txt
```

- Deletes everything but the numbers from `test1.txt`, then store them in `test2.txt`.
- CAUTION: do not *ever* use the same file as output that was input.
  - Example: `tr -cd '0-9' < original.txt > original.txt`

Redirection Example

- Bash processes I/O redirection from left to right, allowing us to do fun things like this:

Magic

```
tr -cd '0-9' < test1.txt > test2.txt
```

- Deletes everything but the numbers from `test1.txt`, then store them in `test2.txt`.
- CAUTION: do not *ever* use the same file as output that was input.
  - Example: `tr -cd '0-9' < original.txt > original.txt`
  - You will *lose* all your data, you cannot read and write this way.

Redirection Example

- Bash processes I/O redirection from left to right, allowing us to do fun things like this:

Magic

```
tr -cd '0-9' < test1.txt > test2.txt
```

- Deletes everything but the numbers from `test1.txt`, then store them in `test2.txt`.
- CAUTION: do not *ever* use the same file as output that was input.
  - Example: `tr -cd '0-9' < original.txt > original.txt`
  - You will *lose* all your data, you cannot read and write this way.

- Piping and Redirection are quite sophisticated, please refer to the Wikipedia page in [4].
